New nucleic acids encoding AINTEGUMENTA-like polypeptides useful improving agronomic, horticultural, and quality traits of plants, increased size of plant organs. in such as

WPI; 2002-599798/64. N-PSDB; ABN84480.

Claim 3; Page 130-133; 169pp; English

The present sequence is the protein sequence of GmANT1, a newly identified AINTECUMENTA-like (ANT-like) polypeptide of soybean. The sequence is predicted from clone CPR67663 (see ABN84480), which was obtained from a soybean sequence database screening using Arabidopsis ANT as query. Also isolated was clone CPR67626 encoding GmANT2 (see ABR9637). GmANT1 and GmANT2 show homology to ANT in 2 N-terminal AP2 DNA binding domains, but have C-terminal sequences that bear little, if any, homology to ANT although they share conserved segments with each other. The invention provides nucleic acids encoding ANT-like polypeptides comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from those given in ABB79629-35. ANT-like polypeptides have been identified in soybean,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  rice, cotton and corn (see ABB79636-41). Nucleic acids (see ABN84480-86) encoding the ANT-like polypeptides can be used in the construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato (all claimed) having improved agronomic, horticultural or other quality traits, such as increased size of plant organs. These plants are especially useful for production of ethanol or animal feedstuff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 663

The present sequence is the protein sequence of GmANT2, a newly condentified AINTGGUMENTA-like (ANT-like) polypeptide of soybean. The consequence is predicted from clone CPR67626 (see ABN84481), which was cobtained from a soybean sequence database screening using Arabidopsis ANT cobtained from a soybean sequence database screening using Arabidopsis ANT comparison, but have C-terminal sequences that bear little, if any, comparison, but have C-terminal sequences that bear little, if any, comparison, in the N-terminal colds encoding ANT-like polypeptides comparising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding comparison, and corn (see ABB79636-41). Nucleic acids encoding the ANT-like polypeptides have been identified in soybean, conton and corn (see ABB79636-41). Nucleic acids (see ABN84480-86) concording the ANT-like polypeptides can be used in the construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, cotton and corn (see ABB79636-41). Nucleic acids (see ABN84480-86) cornotes or potato (all claimed) having improved agronomic, horticultural cornother quality traits, such as increased size of plants organs. These collected from those guence collected from those guence collected from those guence content quality traits, such as increased size of plants organs. These collected from those specially useful for production of ethanol or animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acids encoding AINTEGUMENTA-like polypeptides useful in improving agronomic, horticultural, and quality traits of plants, such increased size of plant organs.

      The present sequence is the protein sequence of OSANT1, a newly identified AINTEGUMENDA-like (ANY-like) polypeptide of rice. The sequence was predicted from a cDNA clone (see AAN94482) obtained from panicle RNA by PCR amplification. OSANT1 cDNA was not amplified from root or leaf RNAs, suggesting tissue-specific expression. Initial OSANT1 clones had been identified in a rice database screening using the newly identified soybean ANT-like polypeptide GMANT1 as query. An additional real ANT-like polypeptide, OSANT1 (see ABB79639), was also isolated. OSANT1 polypeptide shares high homology with Arabidopsis ANT, GMANT1 and GMANT2 at the N-
                                                                                                                                                                                                                                                                                                                                                                 New nucleic acids encoding AINTEGUMENTA-like polypeptides useful in improving agronomic, horticultural, and quality traits of plants, sincreased size of plant organs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Rice AINTEGUMENTA-like polypeptide OSANT1.

The invention provides nucleic acids encoding ANT-like polypeptides comprising, in the N-terminal to C-terminal direction, 2 AP2 DNA binding domains followed by an amino acid subsequence selected from those given in ABB79629-35. ANT-like polypeptides were identified in soybean, rice, cotton and corn (see ABB79636-41). Nucleic acids (see ABN84480-86) encoding the ANT-like polypeptides can be used in the construction of transgenic plants, especially corn, soybean, canola, wheat, cotton, tomato or potato claimed) having improved agronomic, horticultural or other quality traits, such as increased size of plant organs. These plants are especially useful for production of ethanol or animal feedstuff
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 642

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is the protein sequence of OsANT2, a newly identified AINTEGUMENTA-like (ANT-like) polypeptide of rice. The sequence concluded and a genomic DNA sequence (see ABN94483) obtained from a crice database screening. An additional rice ANT-like polypeptide, OsANT1 (see ABB79638), was also identified. The invention provides nucleic acids component and concluded and the polypeptides comprising, in the N-terminal to C-cerminal direction, 2 AP2 DNA binding domains followed by an amino acid combsequence selected from those given in ABB79629-35. ANT-like polypeptides were identified in soybean, rice, cotton and corn (see CC polypeptides were identified in soybean, rice, cotton and corn (see CC polypeptides can be used in the construction of transgenic plants, cespecially corn, soybean, canola, wheat, cotton, tomato or potato (all claimed) having improved agronomic, horticultural or other quality traits, such as increased size of plant organs. These plants are conspecially useful for production of ethanol or animal feedstuff

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents an aintegumenta (ANT) polypeptide. The ANT gene is expressed and functions not only in developing ovules but also in various developing organs. Growth and cell proliferation in plant can be modulated by modulating ANT activity. Modulation of ANT activity is used to alter organ mass, control fertility and enhance assexual reproduction in plants. Increased ANT activity can be used to produce male or female sterile plants. Inhibition of ANT activity can be used to truncate vegetative growth, resulting in early flowering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    N-PSDB;

```

The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (MAP)-kinase activity, LIP15-like transcription factor activity and CKC-like activity, ATP citrate lyase activity, NSNT-like cativity and CKC-like transcription factor activity. Also described: (1) cc complement (II) of (I); (2) a chimeric construct (III) comprising (I) or (II), operably linked to a regulatory sequence; (3) a plant (IV) cc comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5) cc li obtained from (IV). (I) or its part can be used in antisense coil obtained from (IV). (I) or its part can be used in antisense contained the oil phenotype in a plant such as corn, soybean, wheat, rice, canola, Brassica, sorghum, sunflower or coconut. (III) is also useful for creating transgenic plants having altered lipid profiles. (I) can also be used as a hybridisation probe. ACC00626 and ABR40591 to ABR40879 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  맑
The present invention describes an isolated nucleotide fragment (I) comprising a nucleic acid sequence (NS) chosen from a NS encoding a polypeptide (PP) having receptor-like protein kinase activity, mitogen activated protein (MAP)-kinase activity, LIP15-like transcription factor activity and CKC-like transcription factor activity and CKC-like transcription factor activity. Also described: (1) CC complement (II) of (I); (2) a chimeric construct (III) comprising (I) or CC complement (II) in its genome; (4) sequence; (3) a plant (IV) CC comprising (III) in its genome; (4) seeds (V) obtained from (IV); and (5) CC inhibition or co-suppression in a transformed plant. (III) is useful for CC altering the oil phenotype in a plant such as corn, soybean, wheat, rice, CC canola, Brassica, sorghum, sunflower or coconutt. (III) is also useful for CC creating transgenic plants having altered lipid profiles. (I) can also be CC used as a hybridisation probe. ACC00626 to ACC00868 and ABR40591 to

asexual reproduction; early flowering.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an aintegumenta (ANT) polypeptide. The ANT gene is expressed and functions not only in developing ovules but also in various developing organs. Growth and cell proliferation in plant can be modulated by modulating ANT activity. Modulation of ANT activity is used to alter organ mass, control fertility and enhance asexual reproduction in plants. Increased ANT activity can be used to produce male or female sterile plants. Inhibition of ANT activity can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         comprises modulating
